CORE SKILLS

- Copado CI/CD
- SFDX / Copado CLI
- Metadata API
- ANT Migration Tool
- Git / GitHub / Bitbucket
- Salesforce Flows
- Permission Sets
- Sandbox Mgmt
- PMD / Code Analysis
- Merge Conflict Resolution
- PR Governance
- Jira (Copado Connect)
- VS Code Extension Dev
- Quick Deploy
- Validation-Only Deploy

CERTIFICATIONS

- ✓ Copado Certified Consultant
- ✓ Copado Fundamentals I
- ✓ Copado Fundamentals II
- ✓ Copado Source Format Pipelines – 1
- ✓ Copado Source Format Pipelines – 2

EDUCATION

B.Tech — Electronics & Communications
BVCITS, Amalapuram
Andhra Pradesh · 2018

PROFESSIONAL SUMMARY

Results-driven Senior DevOps Engineer and Copado Certified Consultant with 5+ years of experience designing, implementing, and optimising automated CI/CD pipelines and release infrastructure on the Salesforce platform. Proven expertise in setting up Copado pipelines from scratch, automated promotions, conflict resolution, and multi-org deployment strategies for enterprise clients including **Rubrik** and **Hexagon**. Combines deep Salesforce Administration expertise with hands-on pipeline engineering, custom tooling development, and cross-functional stakeholder collaboration to drive release velocity and ROI.

PROFESSIONAL EXPERIENCE

Senior DevOps Engineer · Cloudfulcrum Pvt Ltd · Hyderabad, IN

August 2024 – Present | Client: **Rubrik** | Industry: Technology / Data Management

- Acting as Salesforce DevOps SME — independently designing, configuring, and continuously optimising Copado release pipelines, owning the full CI/CD infrastructure across multiple Salesforce environments with zero missed deployment SLAs.
- Strong hands-on experience setting up Copado CI/CD pipelines from scratch — configuring pipelines, environments, deployment jobs, user story branching, promotion steps, and quality gates end-to-end.
- Managed Salesforce permission sets, profiles, and role hierarchies at scale — performing bulk field-level security audits and ensuring accurate object and record-type permissions aligned with business and compliance requirements.
- Implemented and maintained branching strategies (feature/promotion/release branches) with enforced PR review policies and merge governance, reducing conflicts and improving deployment predictability.
- Served as the go-to resource for Copado CLI — guiding developers on performing partial commits, resolving Git conflicts, and handling branch operations, reducing developer blockers and keeping release pipelines moving.
- Coordinated cross-functional release activities with development, QA, and business stakeholders — scheduling deployment windows, communicating release status, and maintaining rollback plans.
- Applied full sandbox lifecycle management — environment refreshes, data seeding, and consistency validation across Developer, Partial, and Full sandbox orgs.
- Well-versed in Salesforce package-based development concepts — managed, unmanaged, and unlocked packages — with a solid understanding of how package strategies influence org architecture and deployment decisions.
- Authored deployment runbooks, SOPs, and release technotes adopted as team-wide operational standards.

July 2023 – May 2024 | Client: **Hexagon** | Industry: Process Automation / Industrial Software

- Designed and implemented Salesforce automation solutions using Flows, Process Builders, and Approval Processes to support Hexagon's internal DevOps process workflows — streamlining release coordination activities and eliminating manual handoff steps.
- Built screen flows, record-triggered flows, and scheduled flows to enforce governance standards, automate notifications, and maintain data integrity across Salesforce environments throughout the development lifecycle.
- Collaborated with business and technical teams to analyse requirements, translate them into scalable declarative automation solutions, and validate outcomes against defined acceptance criteria.
- Configured validation rules, dynamic layouts, and object customisations to maintain environment stability and support evolving business process requirements.
- Monitored and reported on automation performance and process health — providing stakeholders with regular updates and identifying opportunities for continuous process improvement.
- Maintained Salesforce platform operations including user management, licence assignments, and permission assignments to support consistent developer access and environment governance.

Associate Software Engineer · Genex Technologies · Hyderabad, IN

March 2020 – June 2023 | Industry: IT Services

- Started as a Salesforce Administrator managing user setup, profile configuration, permission sets, role hierarchies, and licence assignments; progressively transitioned into full Salesforce DevOps using SFDX CLI-based deployment workflows.
- Implemented business requirements using Salesforce declarative features — Flows, Process Builders, Validation Rules, and Approval Processes — to streamline business processes and enforce data integrity across sandbox and production environments.
- Utilised SFDX CLI, ANT Migration Tool, Change Sets, and Workbench for structured deployment activities — troubleshooting deployment errors and ensuring consistent metadata state across all environments.
- Set up CI/CD foundations using Copado — configuring user story management, branch governance, and deployment job configurations to introduce structured release management practices to the team.
- Created and managed repositories and branches on GitHub and Bitbucket, enforcing version control best practices, branch naming standards, and merge review processes across the development team.
- Performed data load activities using Apex Data Loader and Workbench; built Reports and Dashboards to provide actionable operational insights to business stakeholders.
- Facilitated user access management across multiple Salesforce environments; supported sandbox creation, refresh, and configuration activities to maintain stable development environments.

CUSTOM TOOLING & PROJECTS

Copado Commit Validator — VS Code Extension · Built for Rubrik Release Operations

- Built a VS Code webview extension used daily by release engineers during QA and UAT deployments — replacing a fully manual verification process with an automated, at-a-glance dashboard per user story.
- Automates branch commit verification: detects extra commits on the branch beyond what Copado registered, checks whether each commit's components are covered by the story's metadata, and flags stories that should be blocked from promotion.
- Checks PR approval status, test run results, merge conflicts, and Copado pipeline state — consolidating checks that previously required navigating multiple tools and screens into a single panel.
- Significantly reduces manual effort and human error in pre-promotion validation across every QA and UAT deployment cycle.

Salesforce Metadata Cleaner — VS Code Extension · Internal DevOps Utility (in active development)

- Built a Copado-integrated VS Code extension that mimics Copado's deployment behaviour specifically for Permission Sets, Profiles, Muting Permission Sets, and Permission Set Groups — the metadata types most prone to environment-specific failures.
- Automatically strips components not applicable to the target org (uninstalled packages, missing fields, org-specific references) before deployment, replacing a time-consuming manual clean-up process.
- Reduced what was a **3-hour manual review and clean-up process** down to approximately **10 minutes** — dramatically improving release velocity and ROI across every deployment cycle.
